

Customer & Commercial Review

Does every promise become a coherent, trustworthy customer journey?

EXECUTIVE VERDICT

NO-GO FOR CUSTOMER-FACING COMMERCE. Marketing can continue only after unsupported or inaccurate claims are removed. Today, customers can enter incompatible journeys, receive success messages without an actionable record, or encounter conflicting price, scheduling, billing, portal, and cancellation logic.

Prepared for	Review date	Scope
Commercial leadership, sales, marketing, customer service, account management, and product	July 15, 2026	Business logic, operating controls, customer trust, and low-skill usability

This review evaluates whether each feature helps the business complete a reliable customer transaction. It is intentionally not a code-quality review. The standard is operational truth: the system should guide the employee, enforce prerequisites, complete all related business effects, and visibly route exceptions.

Review method and scope

Three independent reviews examined the product from the perspectives below, then reconciled their findings into launch gates and operating requirements. The local product source, data model, workflows, business copy, and integrations were inspected. The available hosted deployment could not be opened in the review environment, so this report does not claim a visual usability test of the running production interface.

- Customer: clarity, trust, effort, consent, self-service, service recovery, and consistency between promise and fulfillment.
- Commercial team: lead capture, qualification, pricing, quote conversion, customer identity, retention, and expansion.
- Customer operations: follow-up, reminders, payment recovery, complaint handling, cancellation, and account access.

The strongest finding is the consistency of the conclusions: leadership, customer, and field perspectives all identified the same failure class - a user can complete an apparent action while billing, scheduling, communication, or downstream records remain unfinished or contradictory.

Recommended customer journey

INQUIRY	QUALIFY	QUOTE	ACCEPT	BOOK	SERVE	REPORT / BILL	RETAIN
---------	---------	-------	--------	------	-------	------------------	--------

Every stage must have entry proof, a customer-visible status, an internal owner and SLA, one safe next action, a success confirmation, and a defined recovery when it fails.

What is worth keeping

- Clear specialization in HOA, condominium, and property-management service, with credible licensing, insurance, address, phone, and credential signals.
- Low-friction price preview and a strong concept for schedule-aware availability, provided the quote is eligible, capacity-safe, and honored for a defined lock period.
- Public e-signature, signed PDFs, seven-day and one-day reminders, customer service reports, recommendations, and review requests.
- Passwordless portal access, payment-method self-service, document history, and a useful multi-property foundation.
- The two-program positioning for association service and resident add-ons can differentiate the company if each offer has a precise journey.

P0 customer and commercial blockers

Priority	Business requirement	Acceptance condition
P0	One operational source of truth	Every inquiry, quote, agreement, customer, job, payment, cancellation, and portal identity resolves to one canonical customer record and staff queue.
P0	No false lead acknowledgement	Success appears only after durable capture. Downstream failure creates an owned task. The callback page is fixed or disabled. Repeats dedupe without losing source attribution.
P0	Offer-specific journeys	HOA, standard residential, resident add-on, and specialty services each have explicit qualification, price, scope, capacity, agreement, and fulfillment rules.

Priority	Business requirement	Acceptance condition
P0	Atomic acceptance and activation	Signing creates the correct plan/job, payment requirement, onboarding task, portal access, and truthful confirmation - or a visible pending-activation exception.
P0	One billing-start rule per offer	The agreed event triggers billing exactly once. Paid bookings create receipts/invoices. CRM and Stripe reconcile and failures are recoverable.
P0	One cancellation/refund matrix	Appointment, plan, no-access, company/weather, dissatisfaction, refund, credit, jobs, capacity, and notifications are coordinated.
P0	Deliver promised self-service	Build supported booking/cancel/portal paths or remove those public claims. The website login points to the portal that owns the customer's records.
P0	Customer operations queue	Every open promise has state, owner, SLA, next action, and escalation. Contradictory states are prevented or surfaced immediately.

Define the sellable journey by offer type

Offer	Minimum qualification	Commercial rule
HOA / community	Qualification, service area, property facts, authority, walkthrough/assessment, reviewed proposal, signer authority, procurement/insurance, scheduling	Do not auto-contract an unqualified complex property
Standard residential	Instant price/self-book only for pre-approved pests, scopes, property types, geography, margin, duration, and capacity	Route unknown or risky work to assessment
Resident add-on	Invitation tied to master association visit; unit, pest/scope, price, date/window, one-time vs recurring, access/prep, terms, cutoff, capacity	Do not force a blank quarterly subscription
Specialty / termite / wildlife	Custom assessment until the exact scope, licensing, products, duration, exclusions, warranty, and price rules are approved	No unsupported instant quote

Feature-by-feature customer and commercial disposition

Feature	Verdict	Customer/commercial requirement
Marketing site	Keep; align promises	Strong trust and positioning. Every schedule, pay, portal, guarantee, and communication claim must link to a functioning supported journey.
HOA proposal form	Redesign	Capture qualification and trigger review; do not auto-price/contract complex properties that internal rules say require escalation.
Instant quote landing page	Constrain	Use only for eligible scopes. Label estimate vs binding price consistently and show assumptions, term, taxes/fees, and lock period.
Callback landing page	Block now	It can show success even when required data is rejected. No customer promise may be acknowledged without a durable lead and SLA.
Main quote form	Clarify and separate	No-obligation quote cannot silently become an immediate contract. Make the action, price status, next step, and consent explicit.
Lead intake	Migrate	Public leads must enter the same CRM employees use, with source, dedupe, consent, owner, stage, and next action.
Lead failure handling	Rebuild	Partial upstream or email failure cannot look like complete success. Preserve the lead first, then recover downstream effects.
Resident in-unit signup	Block until complete	Require actual service, unit, price, date/window, recurrence choice, access/prep, terms, capacity, and confirmation.
Paid public booking	Potentially valuable	Currently not surfaced. Launch only with offer eligibility, atomic capacity, customer identity, receipt, cancellation, and support recovery.

Feature	Verdict	Customer/commercial requirement
Booking cancellation	Block	The emailed cancel route does not exist; eventual cancellation must coordinate Stripe, future jobs, plan status, capacity, refund/credit, and confirmation.
Quote / e-sign	Keep; harden	Add version, expiration, scope, locations, pests, exclusions, fees/tax, authority, guarantee, and atomic activation.
Quote void	Fix	A voided quote cannot leave a usable signing agreement. Linked commercial documents must share lifecycle and audit.
Agreement terms	Expand and govern	Define covered work, exclusions, start, cadence, renewal/price change, missed access, rescheduling, guarantee, cancellation, and authority.
Portal access	Unify	Marketing currently points to the old portal while new records use the new portal. Give customers one dependable account destination.
Portal home	Add actions	Request service, warranty/re-treat, reschedule, cancel, support, update contact/access/safety details, and communication preferences.
Portal documents	Keep	Signed agreements and final reports are strong trust and retention features; add version and correction visibility.
Portal billing	Complete	Let customers pay/retry, see due date and balance, download invoice/receipt, understand refunds/credits, and raise a dispute.
Group portal	Keep; role-scope	Separate property manager, board viewer, AP, resident, regional, and full-account permissions.
Reminders	Keep; enrich	Add prep, service address, self-service reschedule, technician/ETA where supported, preference/consent, and delivery/retry state.
Service completion	Keep; add recovery	Expose delivery status and a guarantee/callback request workflow with ownership, eligibility, and SLA.
Recurring service	Anchor contractually	Use contracted cadence and allowed service window; do not silently drift every cycle from a late completion.
Recurring billing	Automate trigger	Billing cannot depend on an office memory step after the first service. Show and recover failed starts.
Payment failure	Add dunning	Define retry schedule, self-service update/retry, service-hold rule, guarantee eligibility, owner, and escalation.
Cancellation policy	Unify	Current 24-hour, 30-day, three-day refund, and cancel-anytime messages conflict. Approve and publish one matrix.
Retention	Build workflow	Add satisfaction, complaint SLA, save/pause, cancellation reason, renewal/price notice, churn reporting, and win-back eligibility.
Marketing claims	Substantiate	Remove or source unsupported percentage, multiplier, and number-one claims. Privacy/Terms must describe actual communications.

Customer communication events

Moment	Customer message	Required source of truth
Inquiry	Request received, expected response time, reference	Lead storage and owner confirmed
Quote	Quote ready, assumptions, expiration, next step	Approved price/scope/version
Acceptance	Signed/accepted; setup status and outstanding requirements	Conversion and activation result
Payment	Method needed, received, failed, refunded, credited	Ledger/Stripe truth and recovery path
Appointment	Confirmed, prep, rescheduled, canceled	Live schedule and capacity

Moment	Customer message	Required source of truth
Field service	Technician en route, delay, could-not-complete where supported	Current job status
Completion	Service result, report, receipt/invoice, recommendations	Final report, billing disposition, delivery state
Retention	Next expected service, guarantee/callback, satisfaction, renewal/price change	Plan entitlement and service cadence

Each event needs intended, generated, sent, delivered/failed, retried, and acknowledged states where the channel supports them. Never use a green success message as a substitute for durable state.

P1: dependable lifecycle

- Structured lead pipeline with owner, SLA, attempts, qualification, quote follow-up, abandonment, expiration, won/lost reason, and consent.
- Pre-approved public price cards, clear schedule-price disclosure, margin bounds, versioning, and a defined quote-lock period.
- Customer portal actions for payment, retry, service request, guaranteed re-treat, reschedule/cancel, support, profile, access/pet/allergy details, and preferences.
- Payment retry/dunning and service-hold rules, including guarantee treatment for delinquent accounts.
- Contract-anchored recurring service with tolerances and proactive notice when the company moves the visit.
- Cancellation reasons, save/pause offers, complaint-resolution SLA, satisfaction capture, churn reporting, and win-back eligibility.
- Group portal permissions by business role and data category, including billing, contracts, resident/unit data, and reports.
- Approved, reviewable marketing claims and Terms/Privacy language that matches actual practices.

P2: growth and retention leverage

- HOA account dashboard for properties, visits, trends, recommendations, open issues, reports, COI, renewals, and consolidated billing.
- Resident add-on campaigns tied automatically to master visits with cutoff dates and capacity limits.
- Post-service satisfaction branching: happy customers receive a review/referral ask; unhappy customers open a recovery case.
- Technician-found upgrade/add-on proposals with customer approval and margin controls before any charge.
- Referral, renewal, and win-back programs with explicit eligibility and reporting.
- Multilingual communications and accessibility-tested simplified flows.

Customer-facing launch acceptance tests

Scenario	Pass condition
Lead	A failed downstream integration cannot lose the lead or show false success; the employee sees a due-dated recovery task.
Identity	A repeat customer/address is matched or reviewed before creating a duplicate account or conflicting portal access.
Quote	The customer sees one approved price, scope, assumptions, term, expiration, cancellation rule, and next step.
Sign	Acceptance either completes all activation requirements or clearly states pending setup and creates an urgent owned exception.
Book	Capacity is held and atomically claimed; the price and time window are honored and the appointment is visible to dispatch.
Pay	Every charge/refund has a customer-visible receipt/invoice and reconciles to the ledger exactly once.

Scenario	Pass condition
Cancel	One request resolves appointment, plan, billing, refund/credit, future work, access, capacity, and confirmation according to policy.
Portal	The public login reaches the account containing the customer's real records and supported self-service actions.
Failure	Communication or fulfillment failure is visible to customer service with owner, due time, retry, and escalation.

The low-skill-safe operating doctrine

The system decides; the employee confirms.

A frontline employee should see one safe next action, why it is required, and what happens next. The employee should not have to remember a hidden prerequisite, a second screen, or a cleanup step in another record.

Principle	Business rule
One state	Each lead, customer, plan, job, invoice, and exception has one unambiguous business state.
One owner	Every open promise and exception has a named owner, due time, and escalation path.
One primary action	The screen emphasizes the next valid action and suppresses invalid or premature actions.
Complete transactions	Activation, completion, cancellation, and payment update every affected record together.
Guardrails	Price, safety, compliance, scheduling, and financial rules are enforced by the system, not training memory.
Truthful outcomes	The app never says sent, paid, booked, active, or complete unless that exact result is durable.
Manager exceptions	Overrides require a role, reason, evidence where appropriate, and an immutable audit event.
Recoverable failure	A partial failure creates a visible work item; it never disappears into a log or a green success screen.
